O'REILLY®

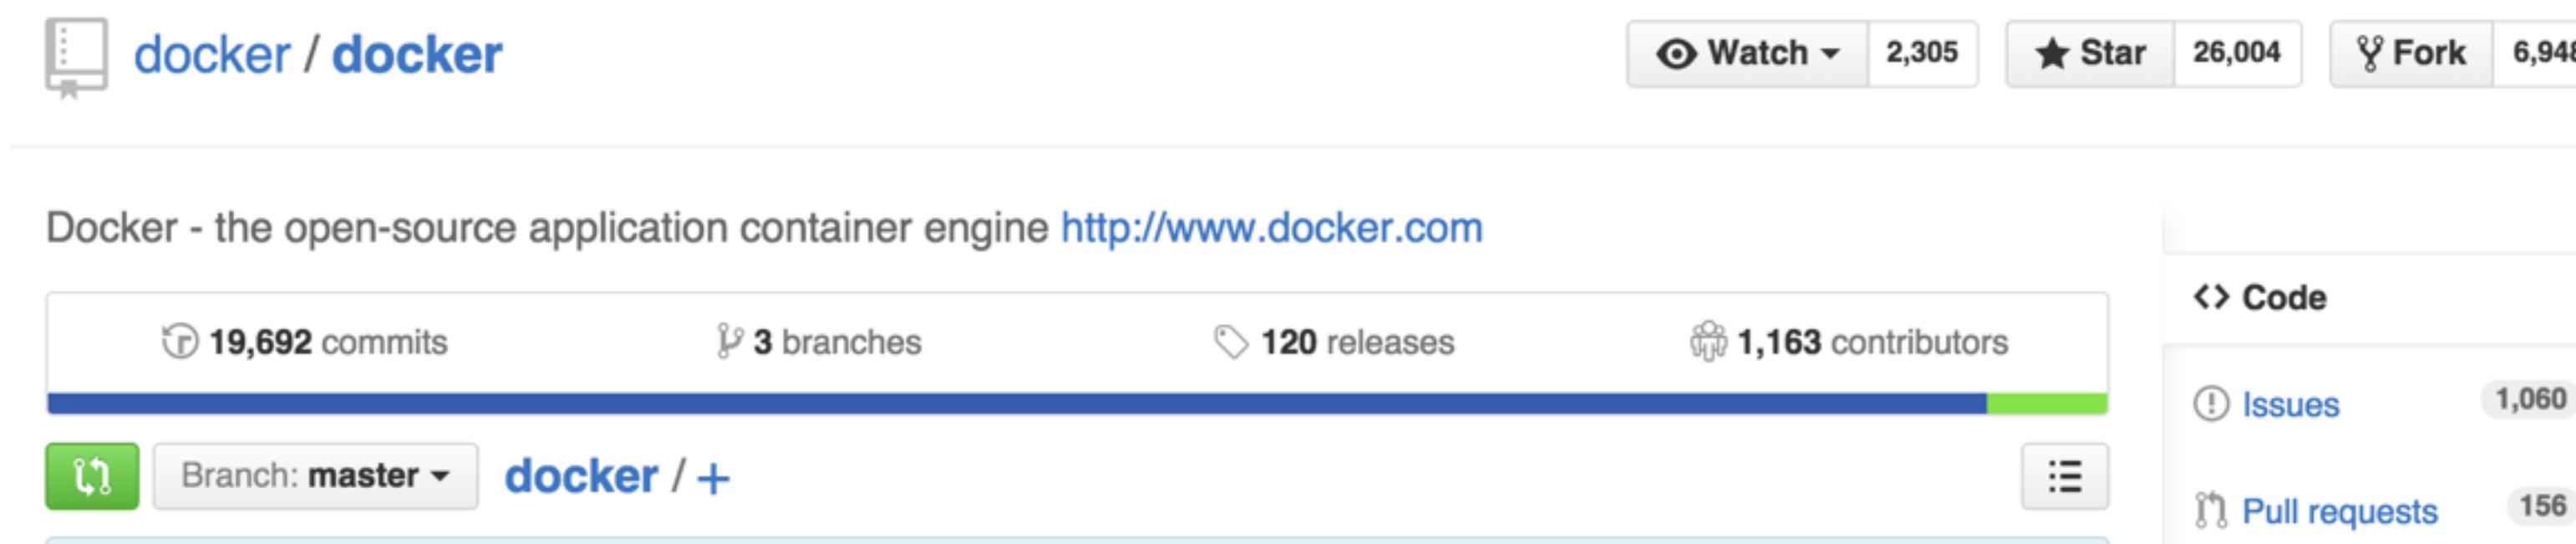

# Minecraft Modding with Forge

A FAMILY-FRIENDLY GUIDE TO BUILDING FUN MODS IN JAVA

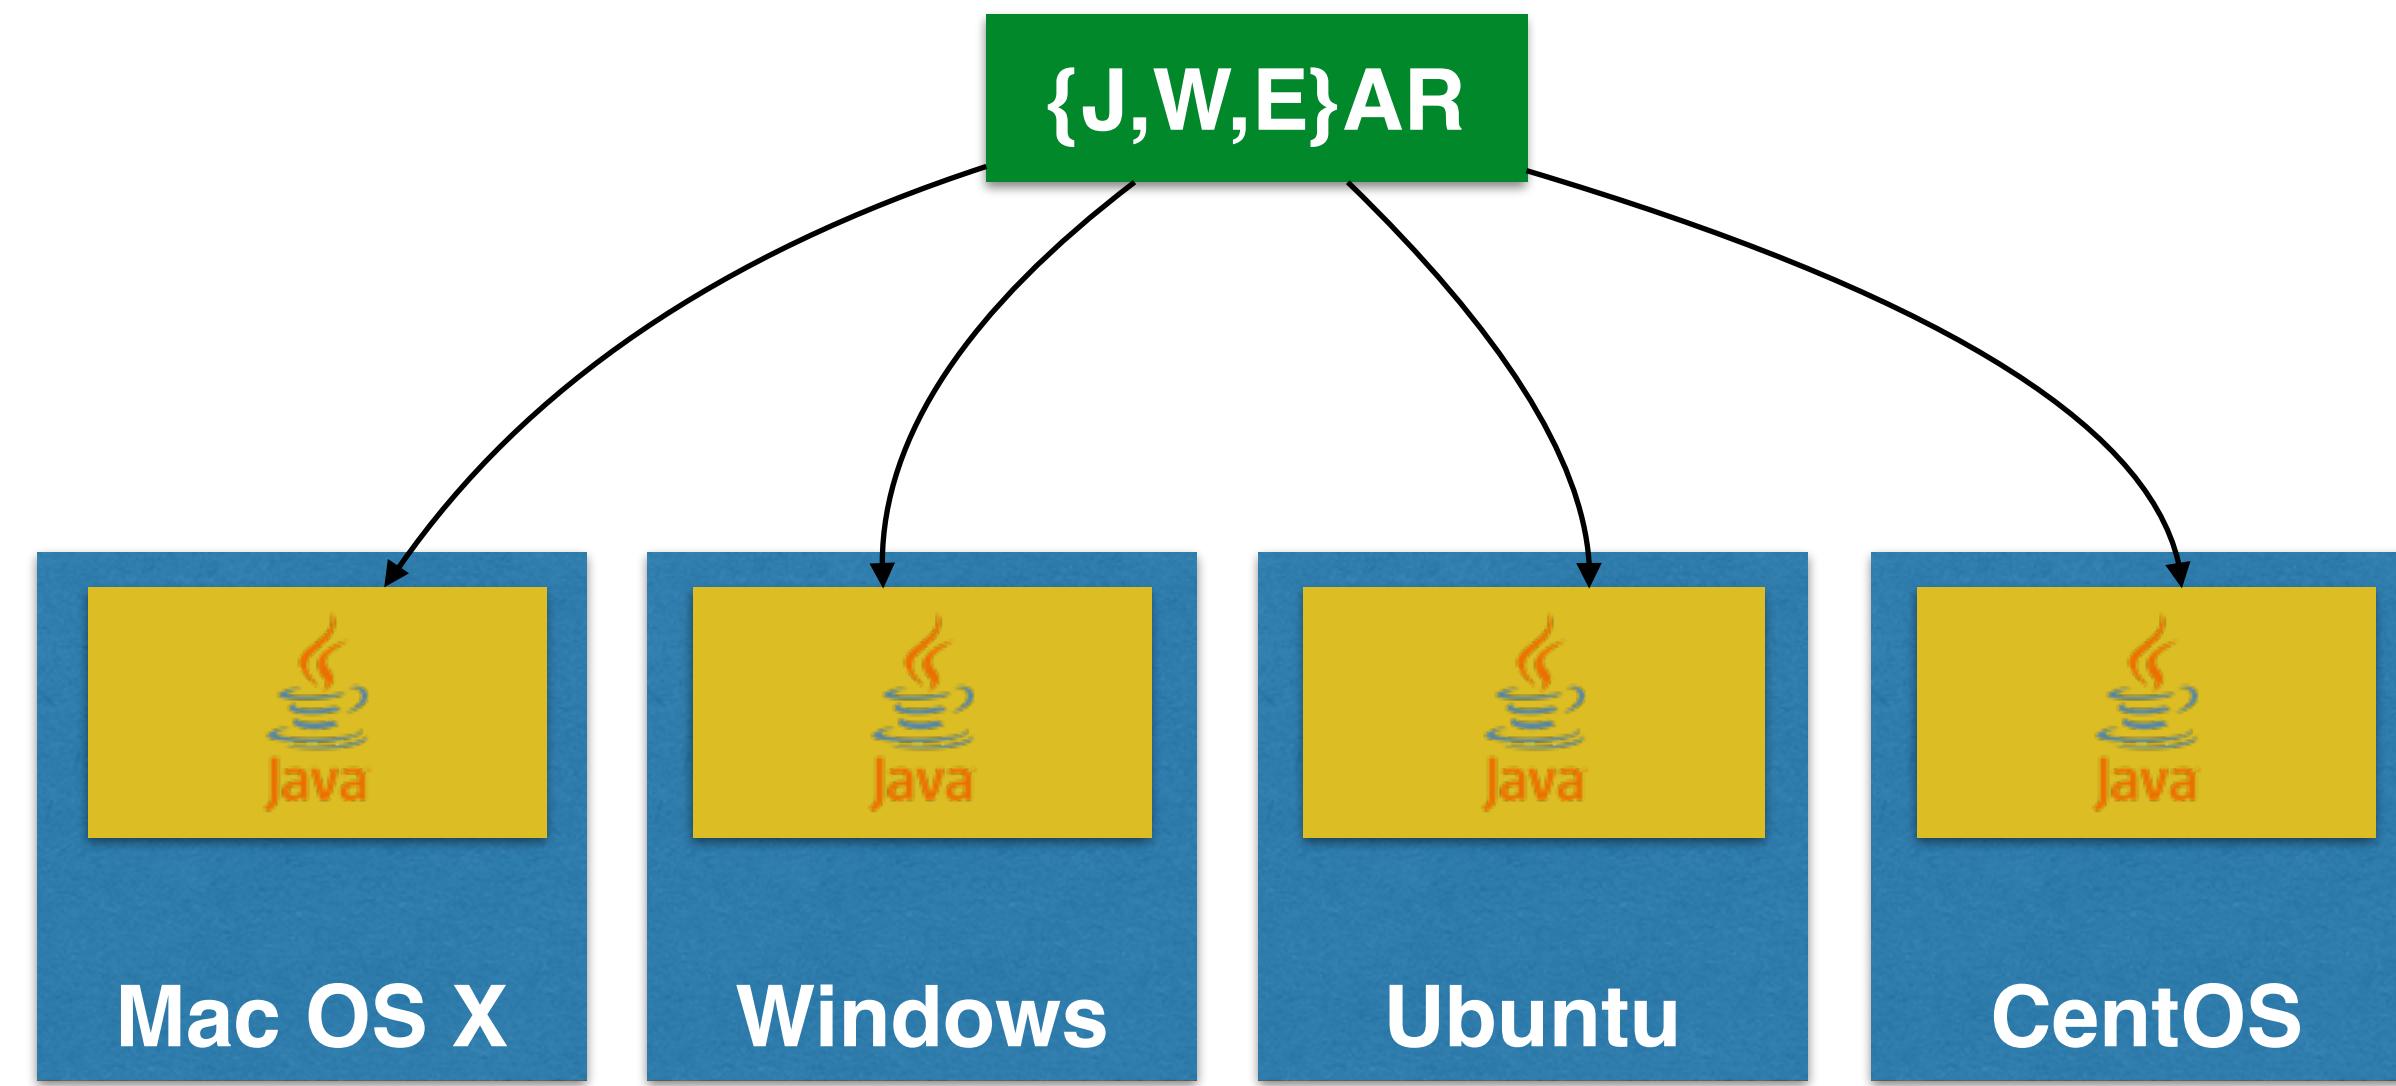

Arun Gupta & Aditya Gupta

# What is Docker?

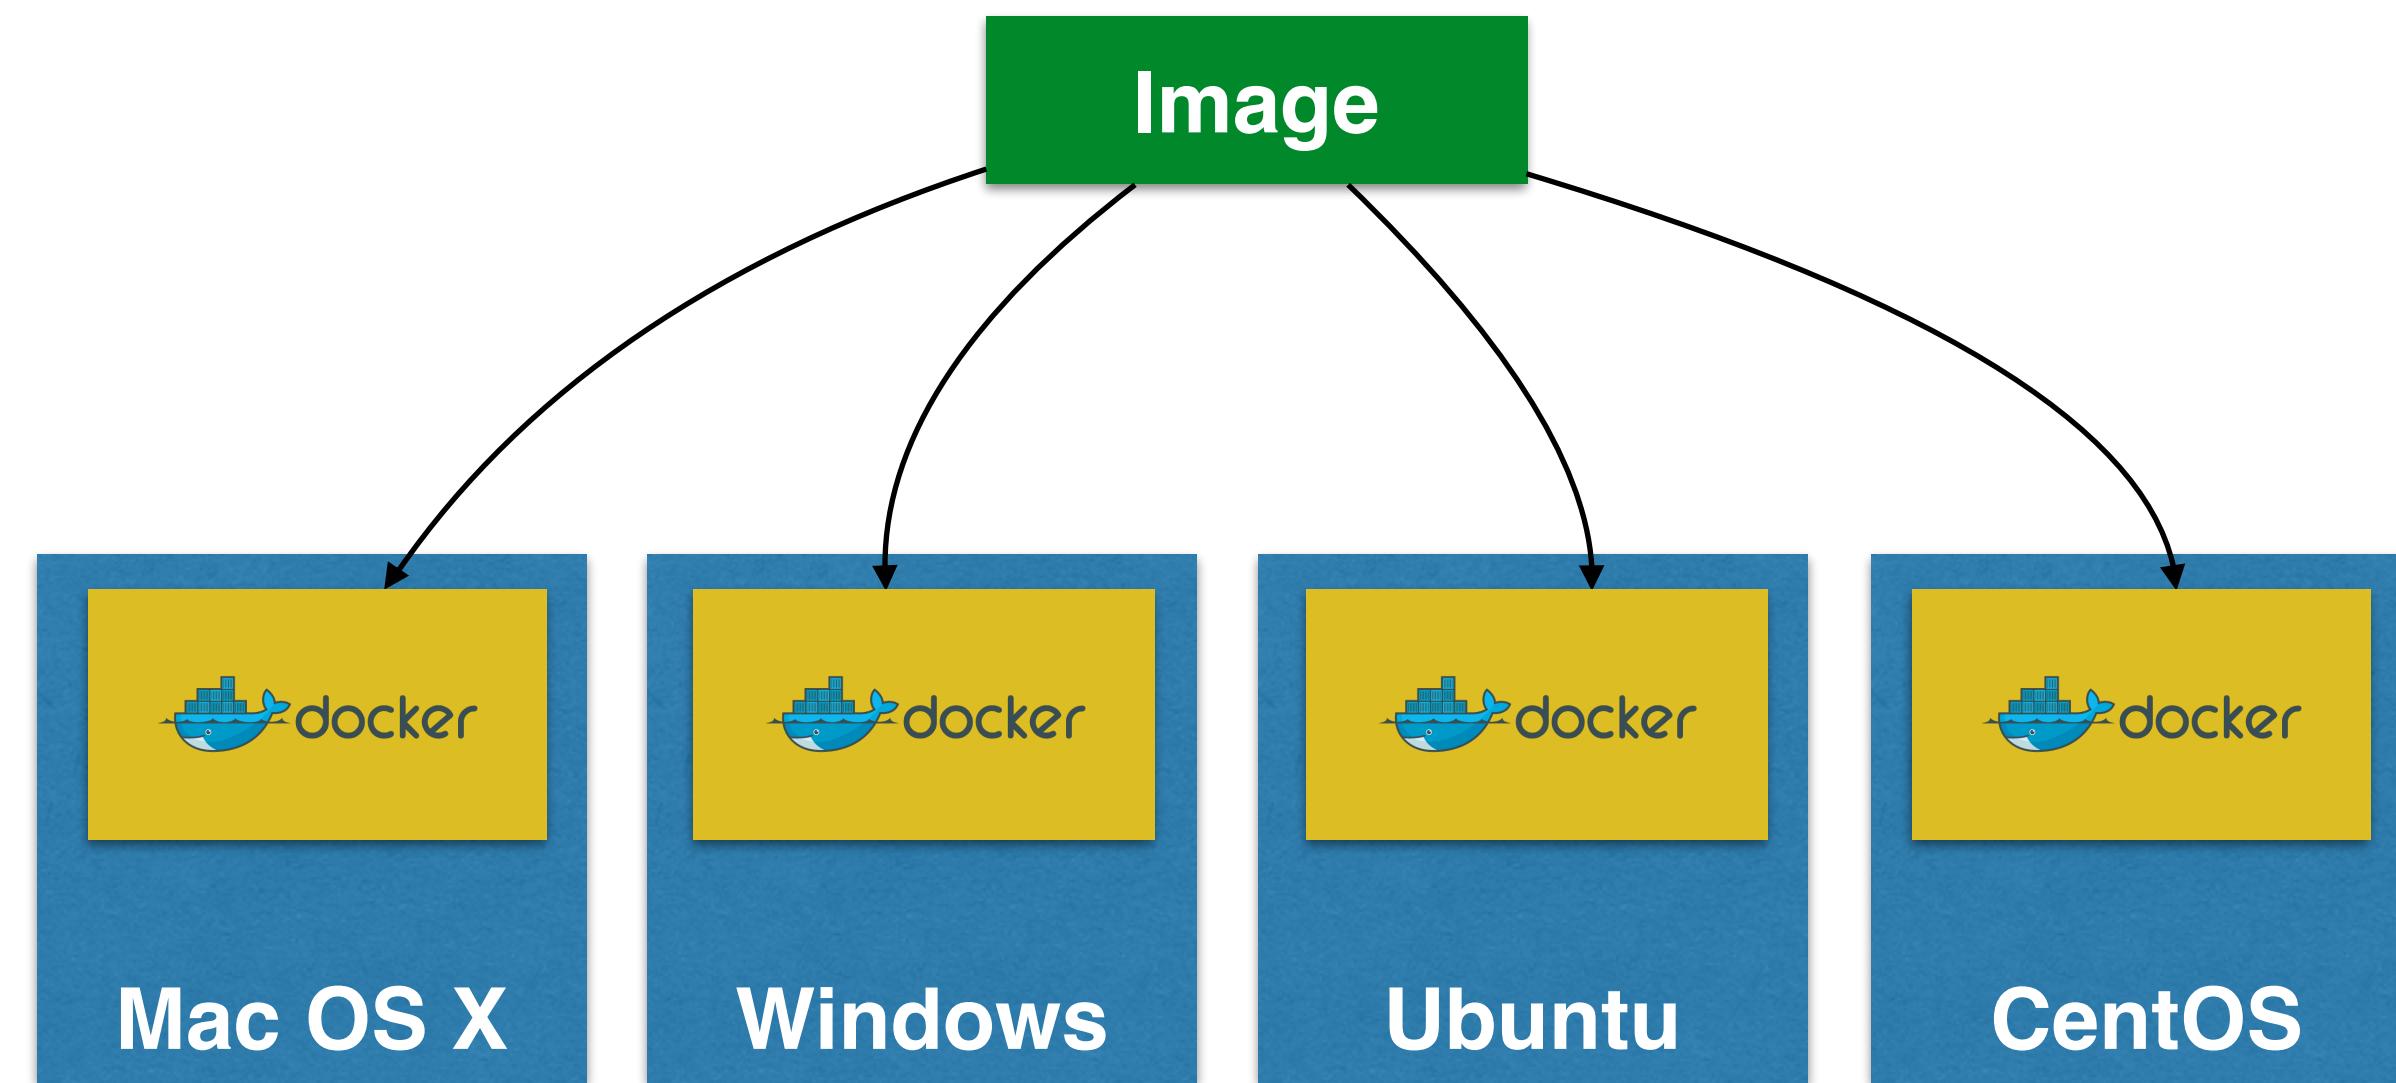

- Open source project and company

- Used to create containers for software applications
- Package Once Deploy Anywhere (PODA)

**WORA = Write Once Run Anywhere**

**PODA = Package Once Deploy Anywhere**

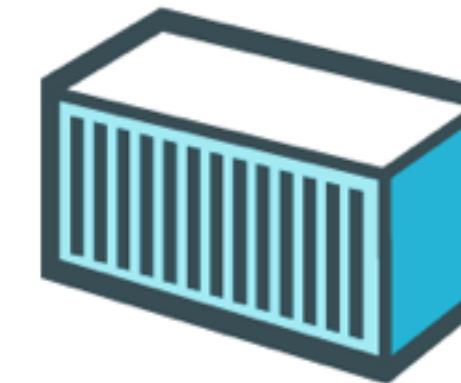

## Build

Develop an app using Docker containers with  
any language and any toolchain.

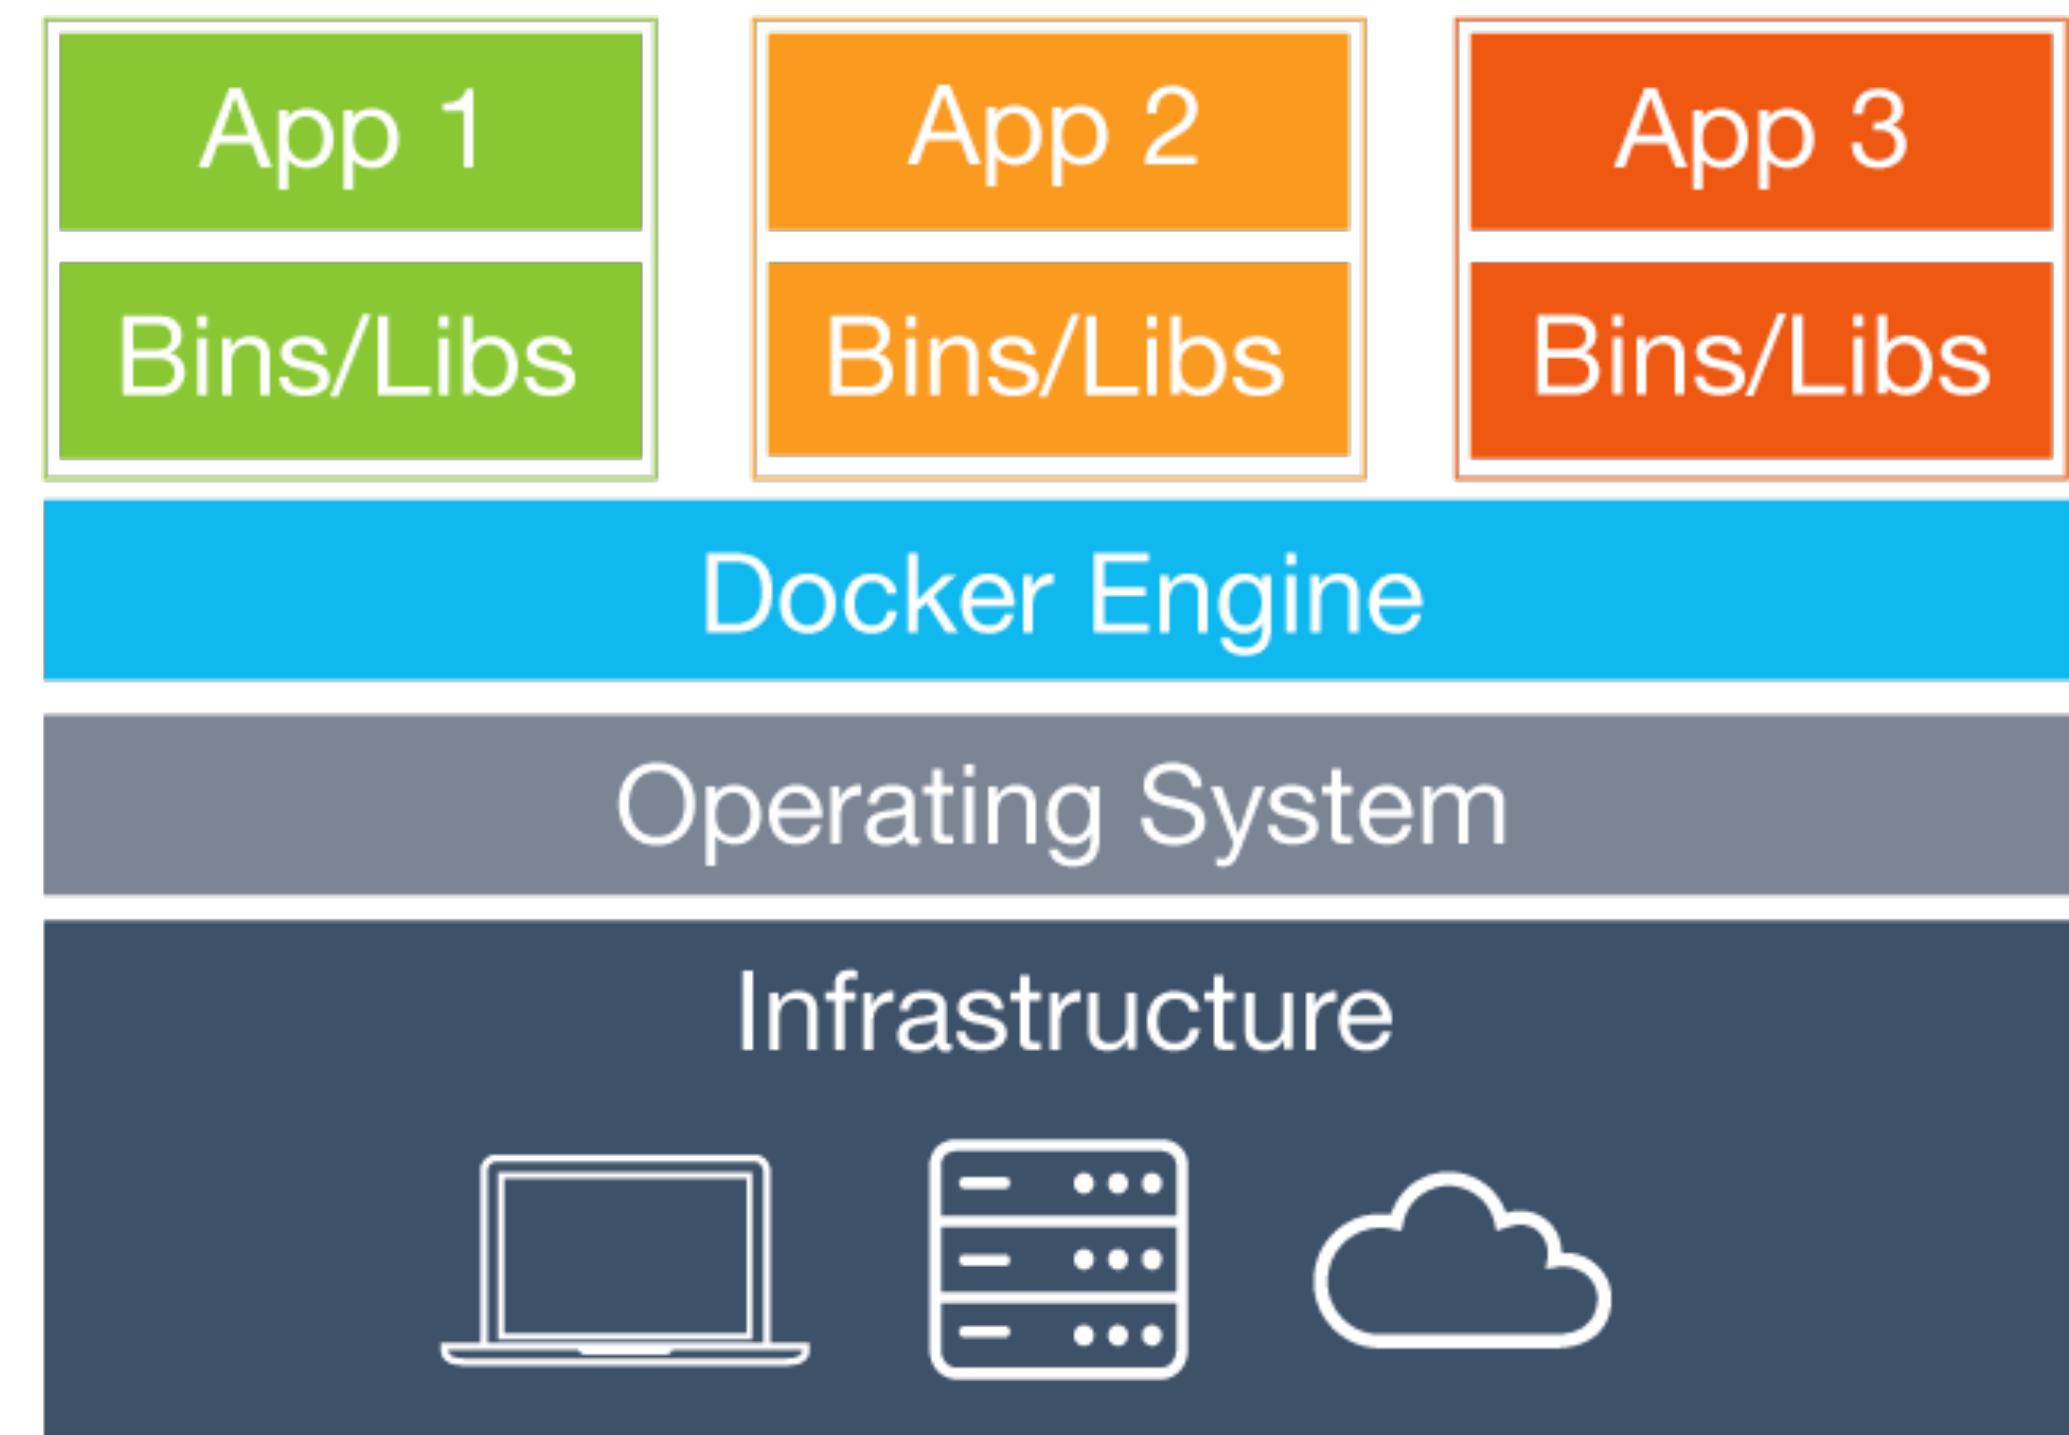

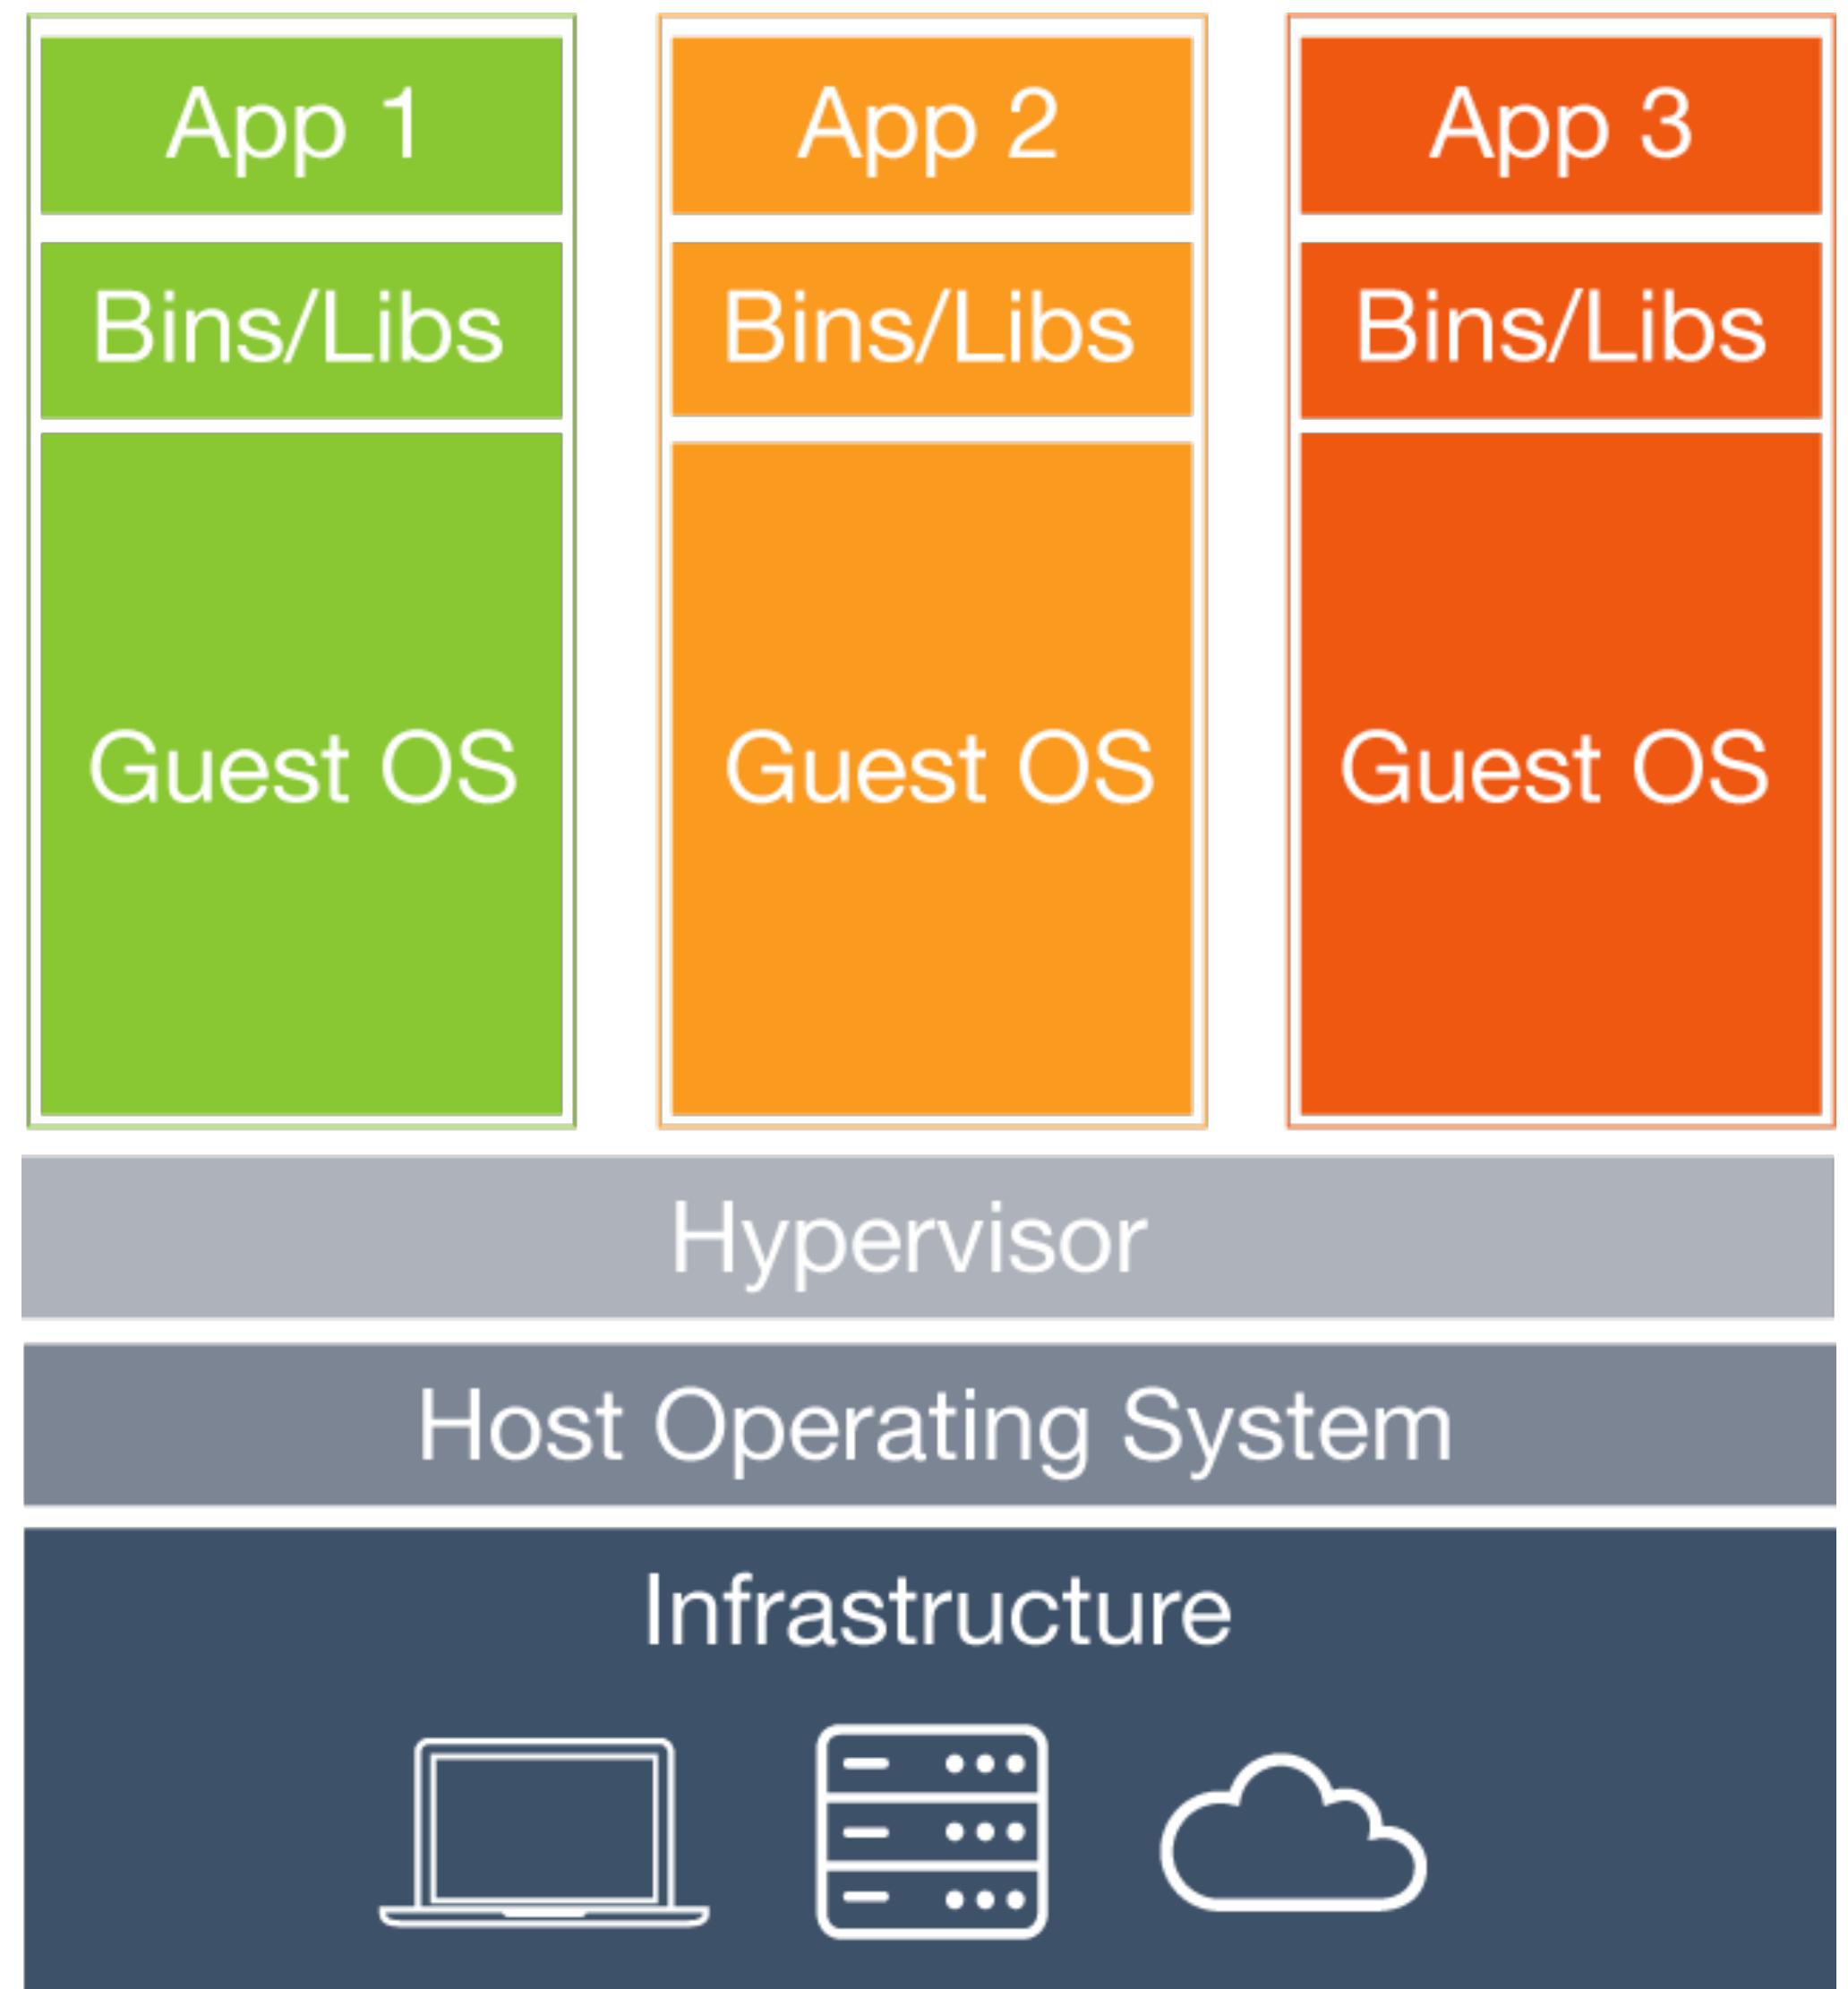

## Run

Scale to 1000s of nodes, move between data  
centers and clouds, update with zero  
downtime and more.

## Ship

Ship the “Dockerized” app and dependencies  
anywhere - to QA, teammates, or the cloud -  
without breaking anything.

Build

Develop an app using Docker containers with  
any language and any toolchain.

- Image defined in text-based **Dockerfile**
- List of commands to build the image

```
FROM fedora:latest

CMD echo "Hello world"
```

```
FROM jboss/wildfly

RUN curl -L https://github.com/javaee-
samples/javaee7-hol/raw/master/solution/
movieplex7-1.0-SNAPSHOT.war -o /opt/jboss/
wildfly/standalone/deployments/
movieplex7-1.0-SNAPSHOT.war
```

# Docker Machine

- Create Docker Host on computer or cloud provider

```
docker-machine create --driver=virtualbox myhost
```

- Configure Docker client to talk to host
- Create and pull images
- Start, stop, restart containers
- Upgrade Docker
- Not recommended for production yet

# Docker Machine Providers

# boot2docker

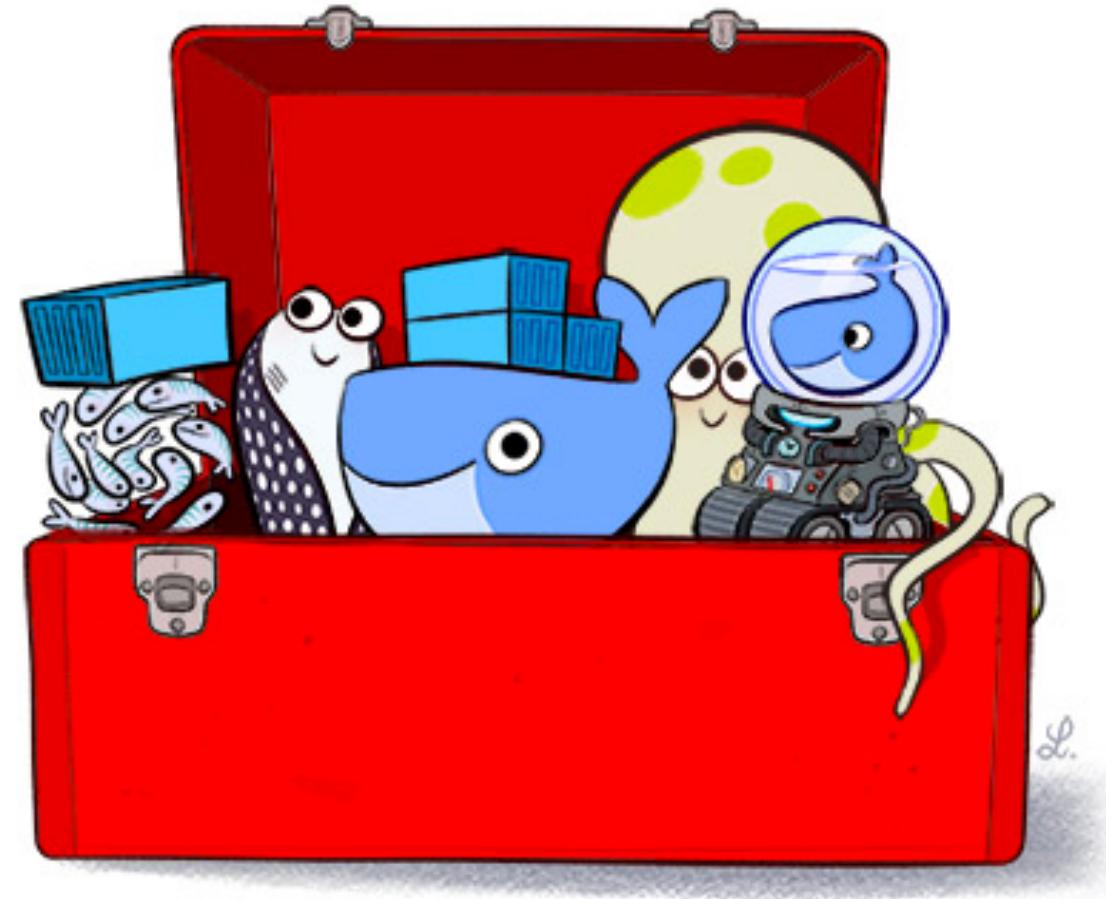

- Migrate to Docker Machine

```
docker-machine
create -d virtualbox
--virtualbox-import-boot2docker-vm
boot2docker-vm docker-vm
```

boot2docker	docker-machine	docker-machine description
init	create	Creates a new docker host.
up	start	Starts a stopped machine.
ssh	ssh	Runs a command or interactive ssh session on the machine.
save	-	Not applicable.
down	stop	Stops a running machine.
poweroff	stop	Stops a running machine.
reset	restart	Restarts a running machine.
config	inspect	Prints machine configuration details.
status	ls	Lists all machines and their status.
info	inspect	Displays a machine's details.
ip	ip	Displays the machine's ip address.
shellinit	env	Displays shell commands needed to configure your shell to interact with a machine
delete	rm	Removes a machine.
download	-	Not applicable.
upgrade	upgrade	Upgrades a machine's Docker client to the latest stable release.

# Docker Toolbox

- Docker Client 1.9.0
- Docker Machine 0.5.0
- Docker Compose 1.5.0 (~~Mac only~~)
- Docker Kitematic 0.9.3
- Boot2Docker ISO 1.9.0
- Virtualbox 5.0.8

# Docker Compose - One Service

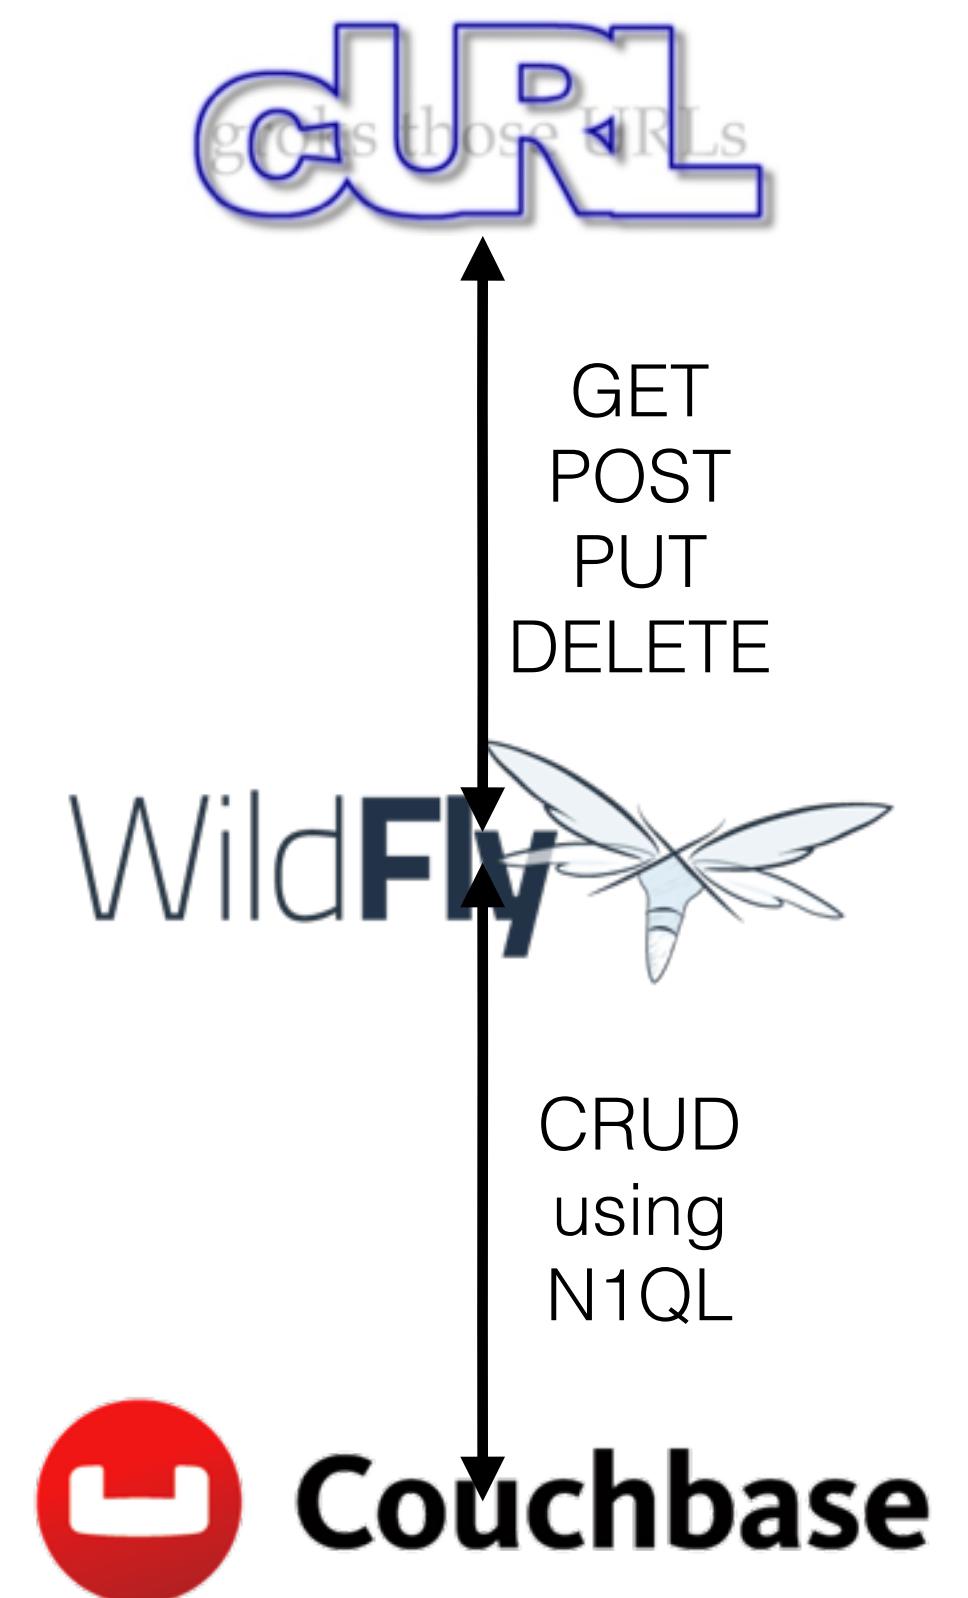

```
mycouchbase:  
  name: mycouchbase  
  image: couchbase/server  
  volumes:  
    - ~/couchbase:/opt/couchbase/var  
  ports:  
    - 8091:8091  
    - 8092:8092  
    - 8093:8093  
    - 11210:11210
```

```
docker run  
--name couchbase  
-p 8091:8091  
-p 8093:8093  
-p 11210:11210  
-v ~/couchbase:/opt/couchbase/var  
-d  
couchbase
```

```
docker run  
--name mywildfly  
--link mycouchbase:cb  
-p 8080:8080  
-d  
arungupta/wildfly-admin
```

# Docker Compose - Two Services

# Docker Compose

- Defining and running multi-container applications
- Configuration defined in one or more files
  - `docker-compose.yml` (default)
  - `docker-compose.override.yml` (default)
  - Multiple files specified using `-f`
  - All paths relative to base configuration file
- Great for dev, staging, and CI

# Docker Compose - Two Services

```
mycouchbase:  
  image: couchbase/server  
  ports:  
    - 8091:8091  
    - 8092:8092  
    - 8093:8093  
    - 11210:11210  
  
mywildfly:  
  image: arungupta/wildfly-admin  
  links:  
    - mycouchbase:cb  
  ports:  
    - 8080:8080  
    - 9990:9990
```

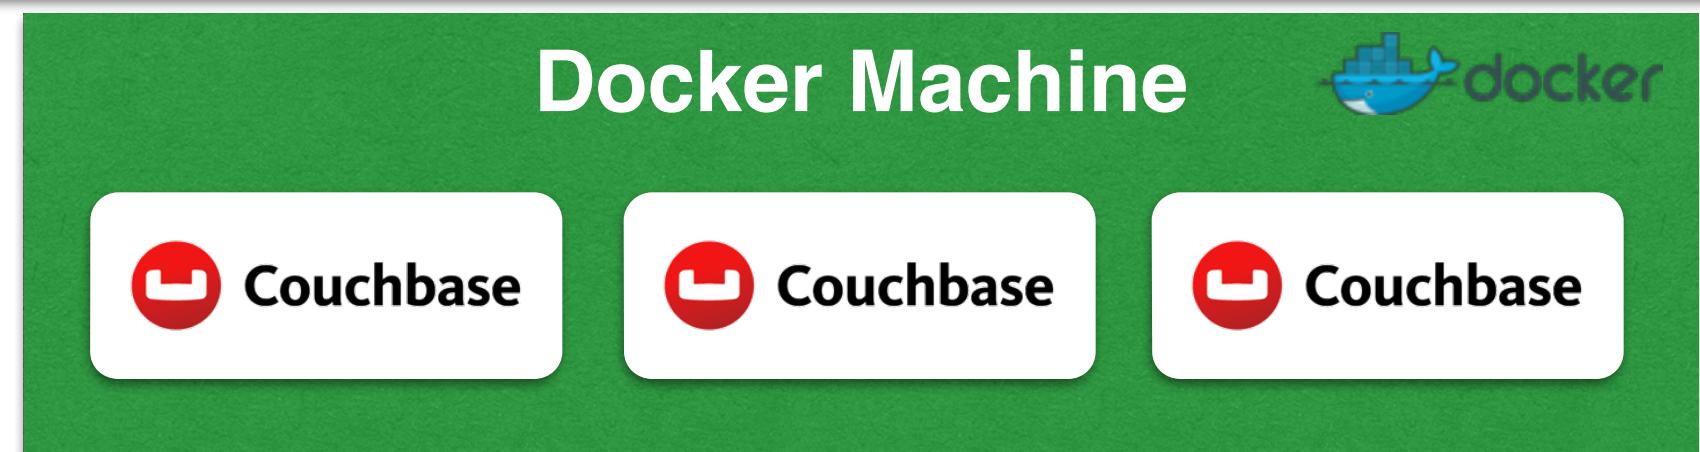

# Docker Compose - Links

```
CouchbaseCluster.create(System.getenv("DB_PORT_8091_TCP_ADDR"));
```

# Docker Compose - Couchbase Cluster

```
couchbase1:  
  image: couchbase/server  
  volumes:  
    - ~/couchbase/node1:/opt/couchbase/var  
couchbase2:  
  image: couchbase/server  
  volumes:  
    - ~/couchbase/node2:/opt/couchbase/var  
couchbase3:  
  image: couchbase/server  
  volumes:  
    - ~/couchbase/node3:/opt/couchbase/var  
  ports:  
    - 8091:8091  
    - 8092:8092  
    - 8093:8093  
    - 11210:11210
```

# Overriding Services in Docker Compose

```
mywildfly:  
  image: jboss/wildfly  
  ports:  
    - 8080:8080
```

docker-compose.yml

```
mywildfly:  
  ports:  
    - 9080:8080
```

docker-compose.override.yml

docker-compose up -d

# Dev/Prod with Compose

```
mycouchbase:  
  container_name: "db-dev"  
  image: couchbase/server  
  ports:  
    - . . .  
mywildfly:  
  image: arungupta/wildfly-couchbase-javee7  
  environment:  
    - COUCHBASE_URI=db-dev:8093  
  ports:  
    - 8080:8080
```

docker-compose.yml

docker-compose up -d

```
mywildfly:  
  environment:  
    - COUCHBASE_URI=db-prod:8093  
  ports:  
    - 80:8080  
mycouchbase:  
  container_name: "db-prod"
```

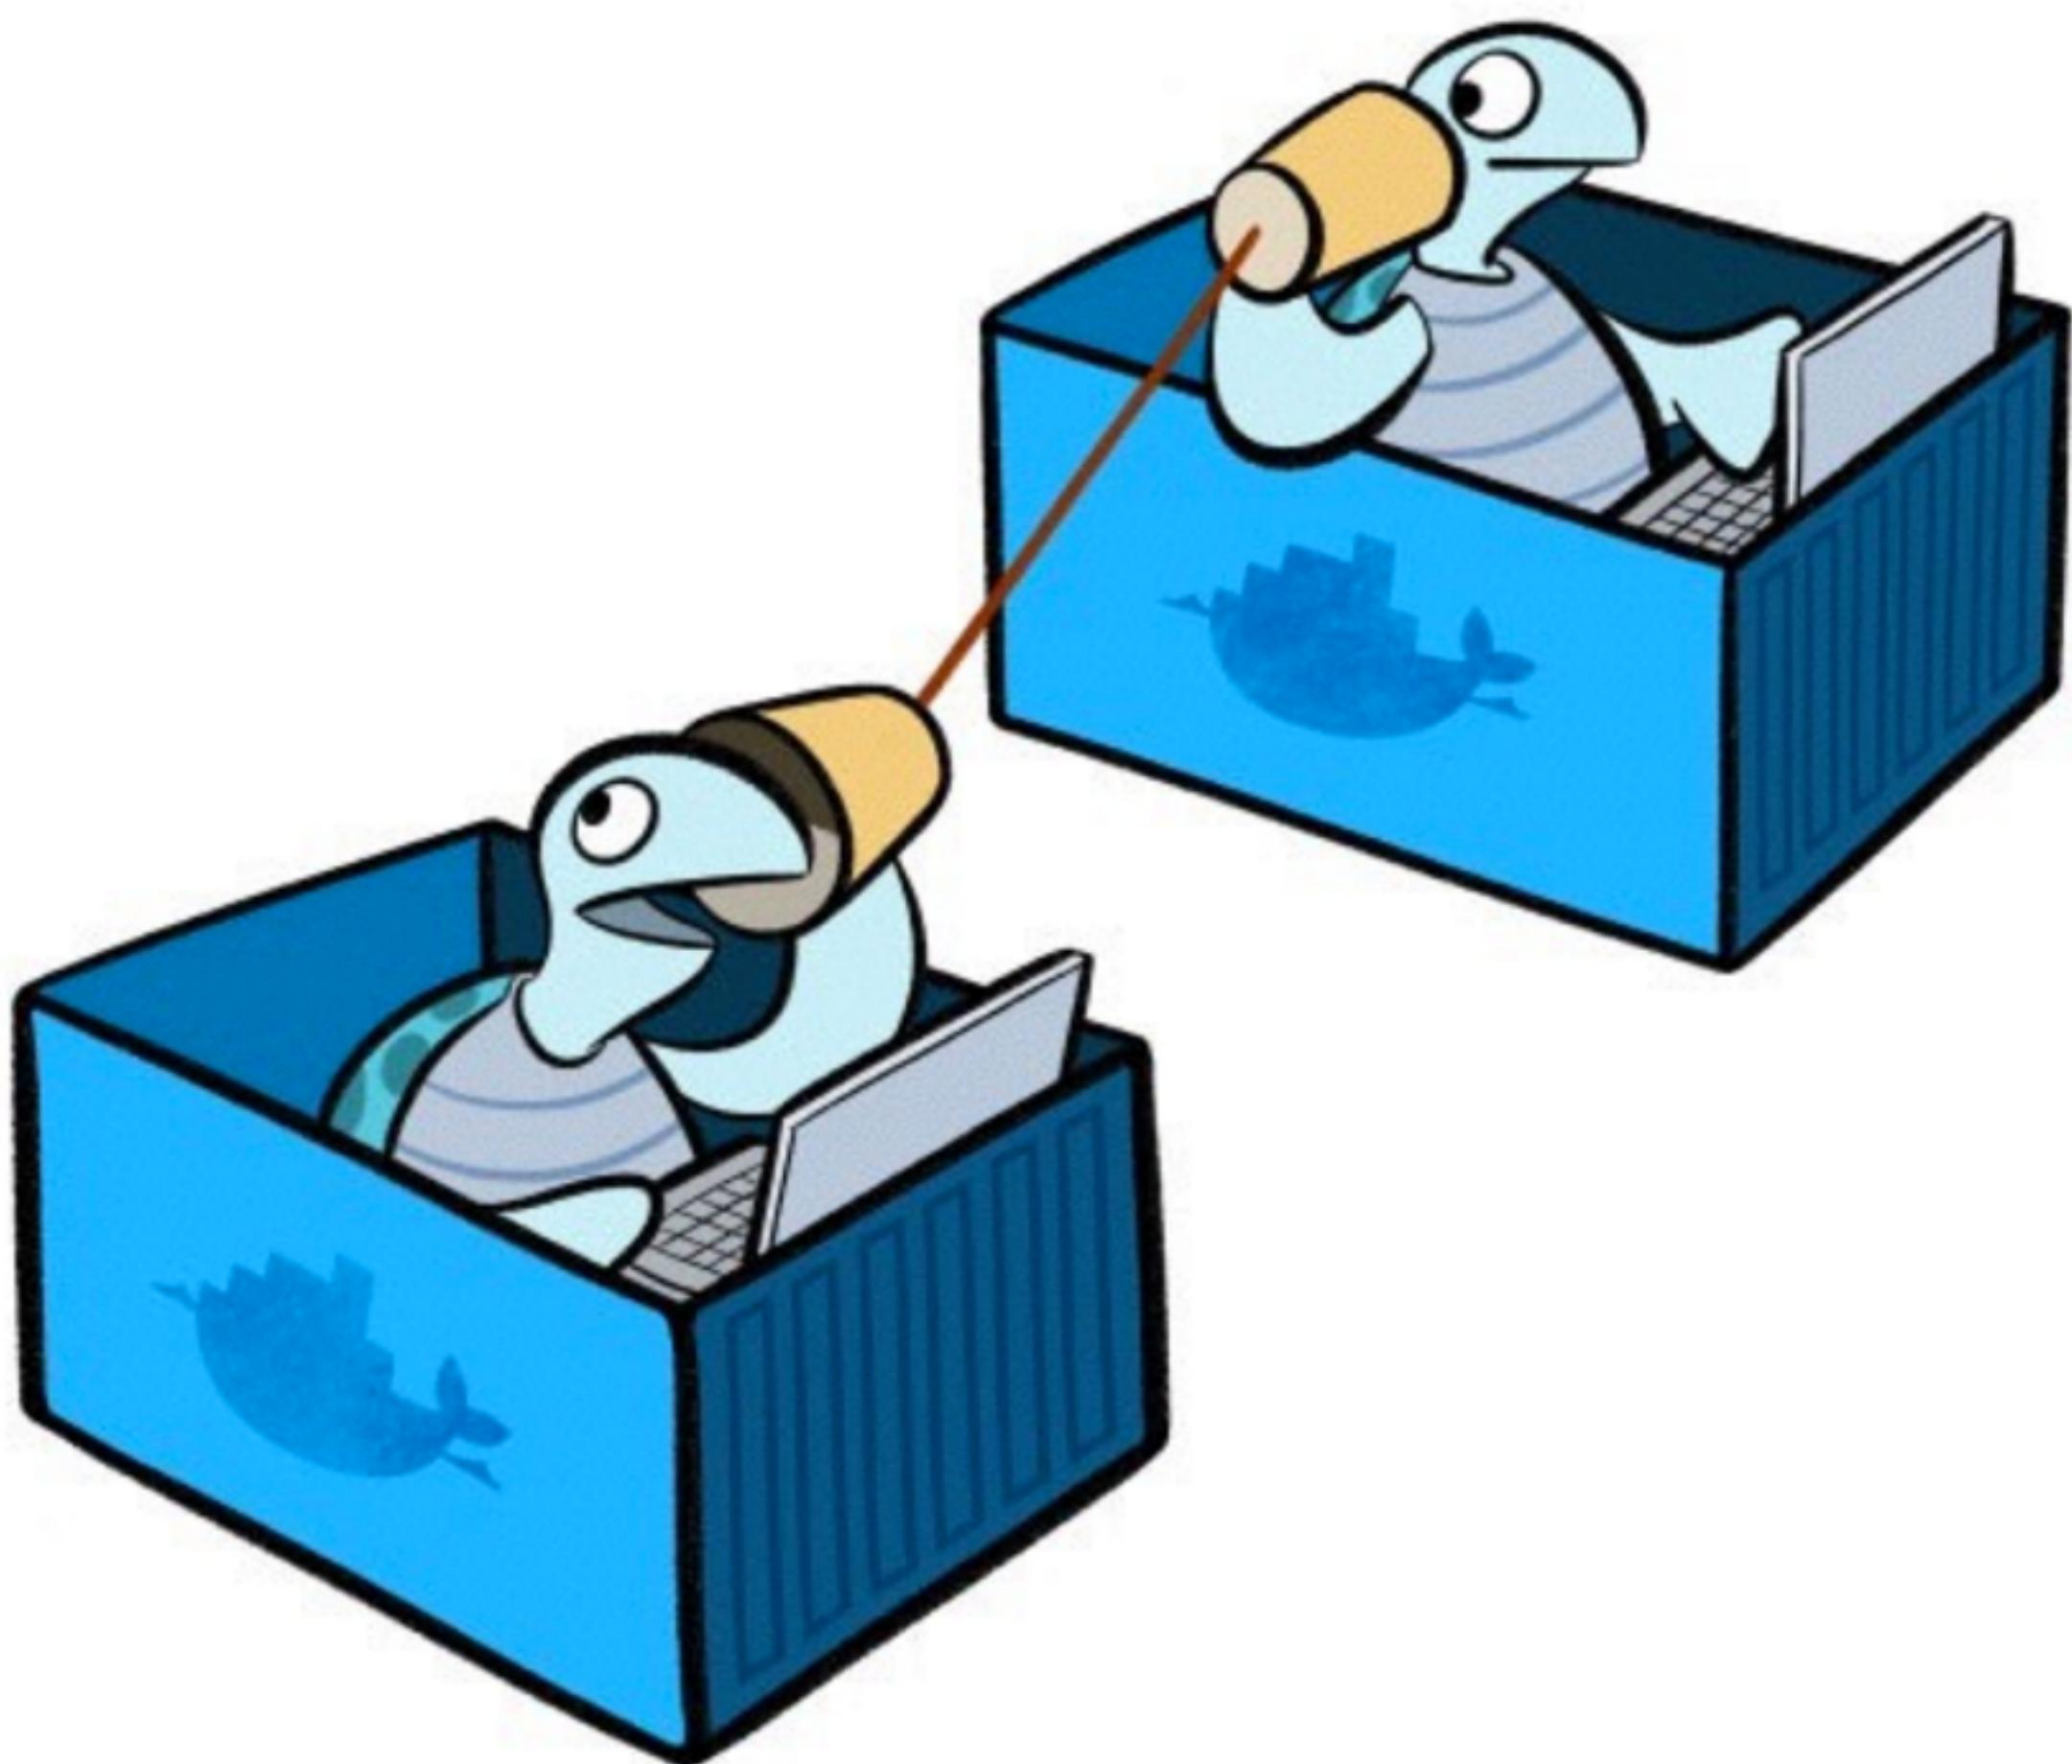

production.yml

docker-compose up  
-f docker-compose.yml  
-f production.yml  
-d

# Compose in Production

- Primarily aimed at development and testing environments
- May be for smaller deployments
- Not suitable for larger deployments

# Multi Host Networking

# Default Networks

```
docker network ls
```

NETWORK ID	NAME	DRIVER
8cf651cafbef	bridge	bridge
14e63204639e	none	null
96901337c96f	host	host

Network Name	Purpose
bridge	Default network that containers connect to
none	Container-specific networking stack
host	Adds container on hosts networking stack

# Multi-host Networking

- Create virtual networks and attach containers
- **Bridge** network spans single host
- **Overlay** network spans multiple hosts
  - Uses `libnetwork` (built-in VXLAN-based overlay network driver) and Docker's `libkv`
- Works with Swarm and Compose
  - Experimental in Compose
  - Pluggable: Calico, Cisco, Weave, . . .

# Networking vs Links

- Connect containers to each other across different physical or virtual hosts
- Containers can be easily stopped, started and restarted w/o disrupting connection to other containers
- Can be created in any order

```
mycouchbase:  
  image: couchbase/server  
  ports:  
    - 8091:8091  
    - 8092:8092  
    - 8093:8093  
    - 11210:11210  
  
mywildfly:  
  image: arungupta/wildfly-admin  
  links:  
    - mycouchbase:cb  
  ports:  
    - 8080:8080  
    - 9990:9990
```

## Links

```
mycouchbase:  
  container_name: "db"  
  image: couchbase/server  
  ports:  
    - 8091:8091  
    - 8092:8092  
    - 8093:8093  
    - 11210:11210  
  
mywildfly:  
  image: arungupta/wildfly-admin  
  environment:  
    - COUCHBASE_URI=db  
  ports:  
    - 8080:8080  
    - 9990:9990
```

## Networking

# Networking - Application Code

```
CouchbaseCluster.create(System.getenv("DB_PORT_8091_TCP_ADDR"));
```

## Links

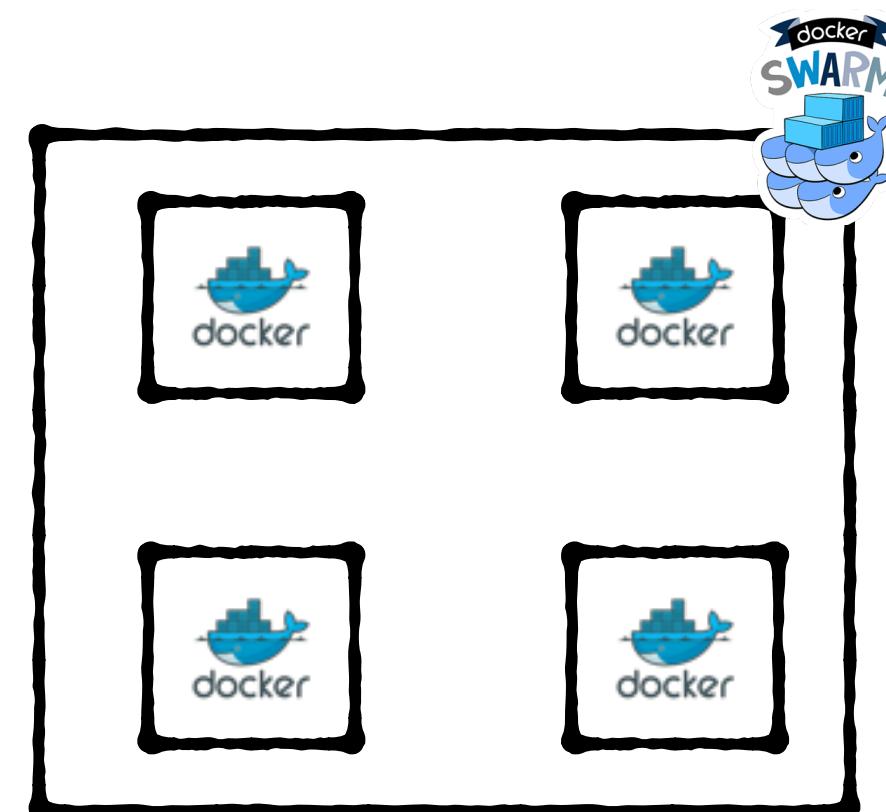

```
CouchbaseCluster.create(System.getenv("COUCHBASE_URI"));
```

## Networking

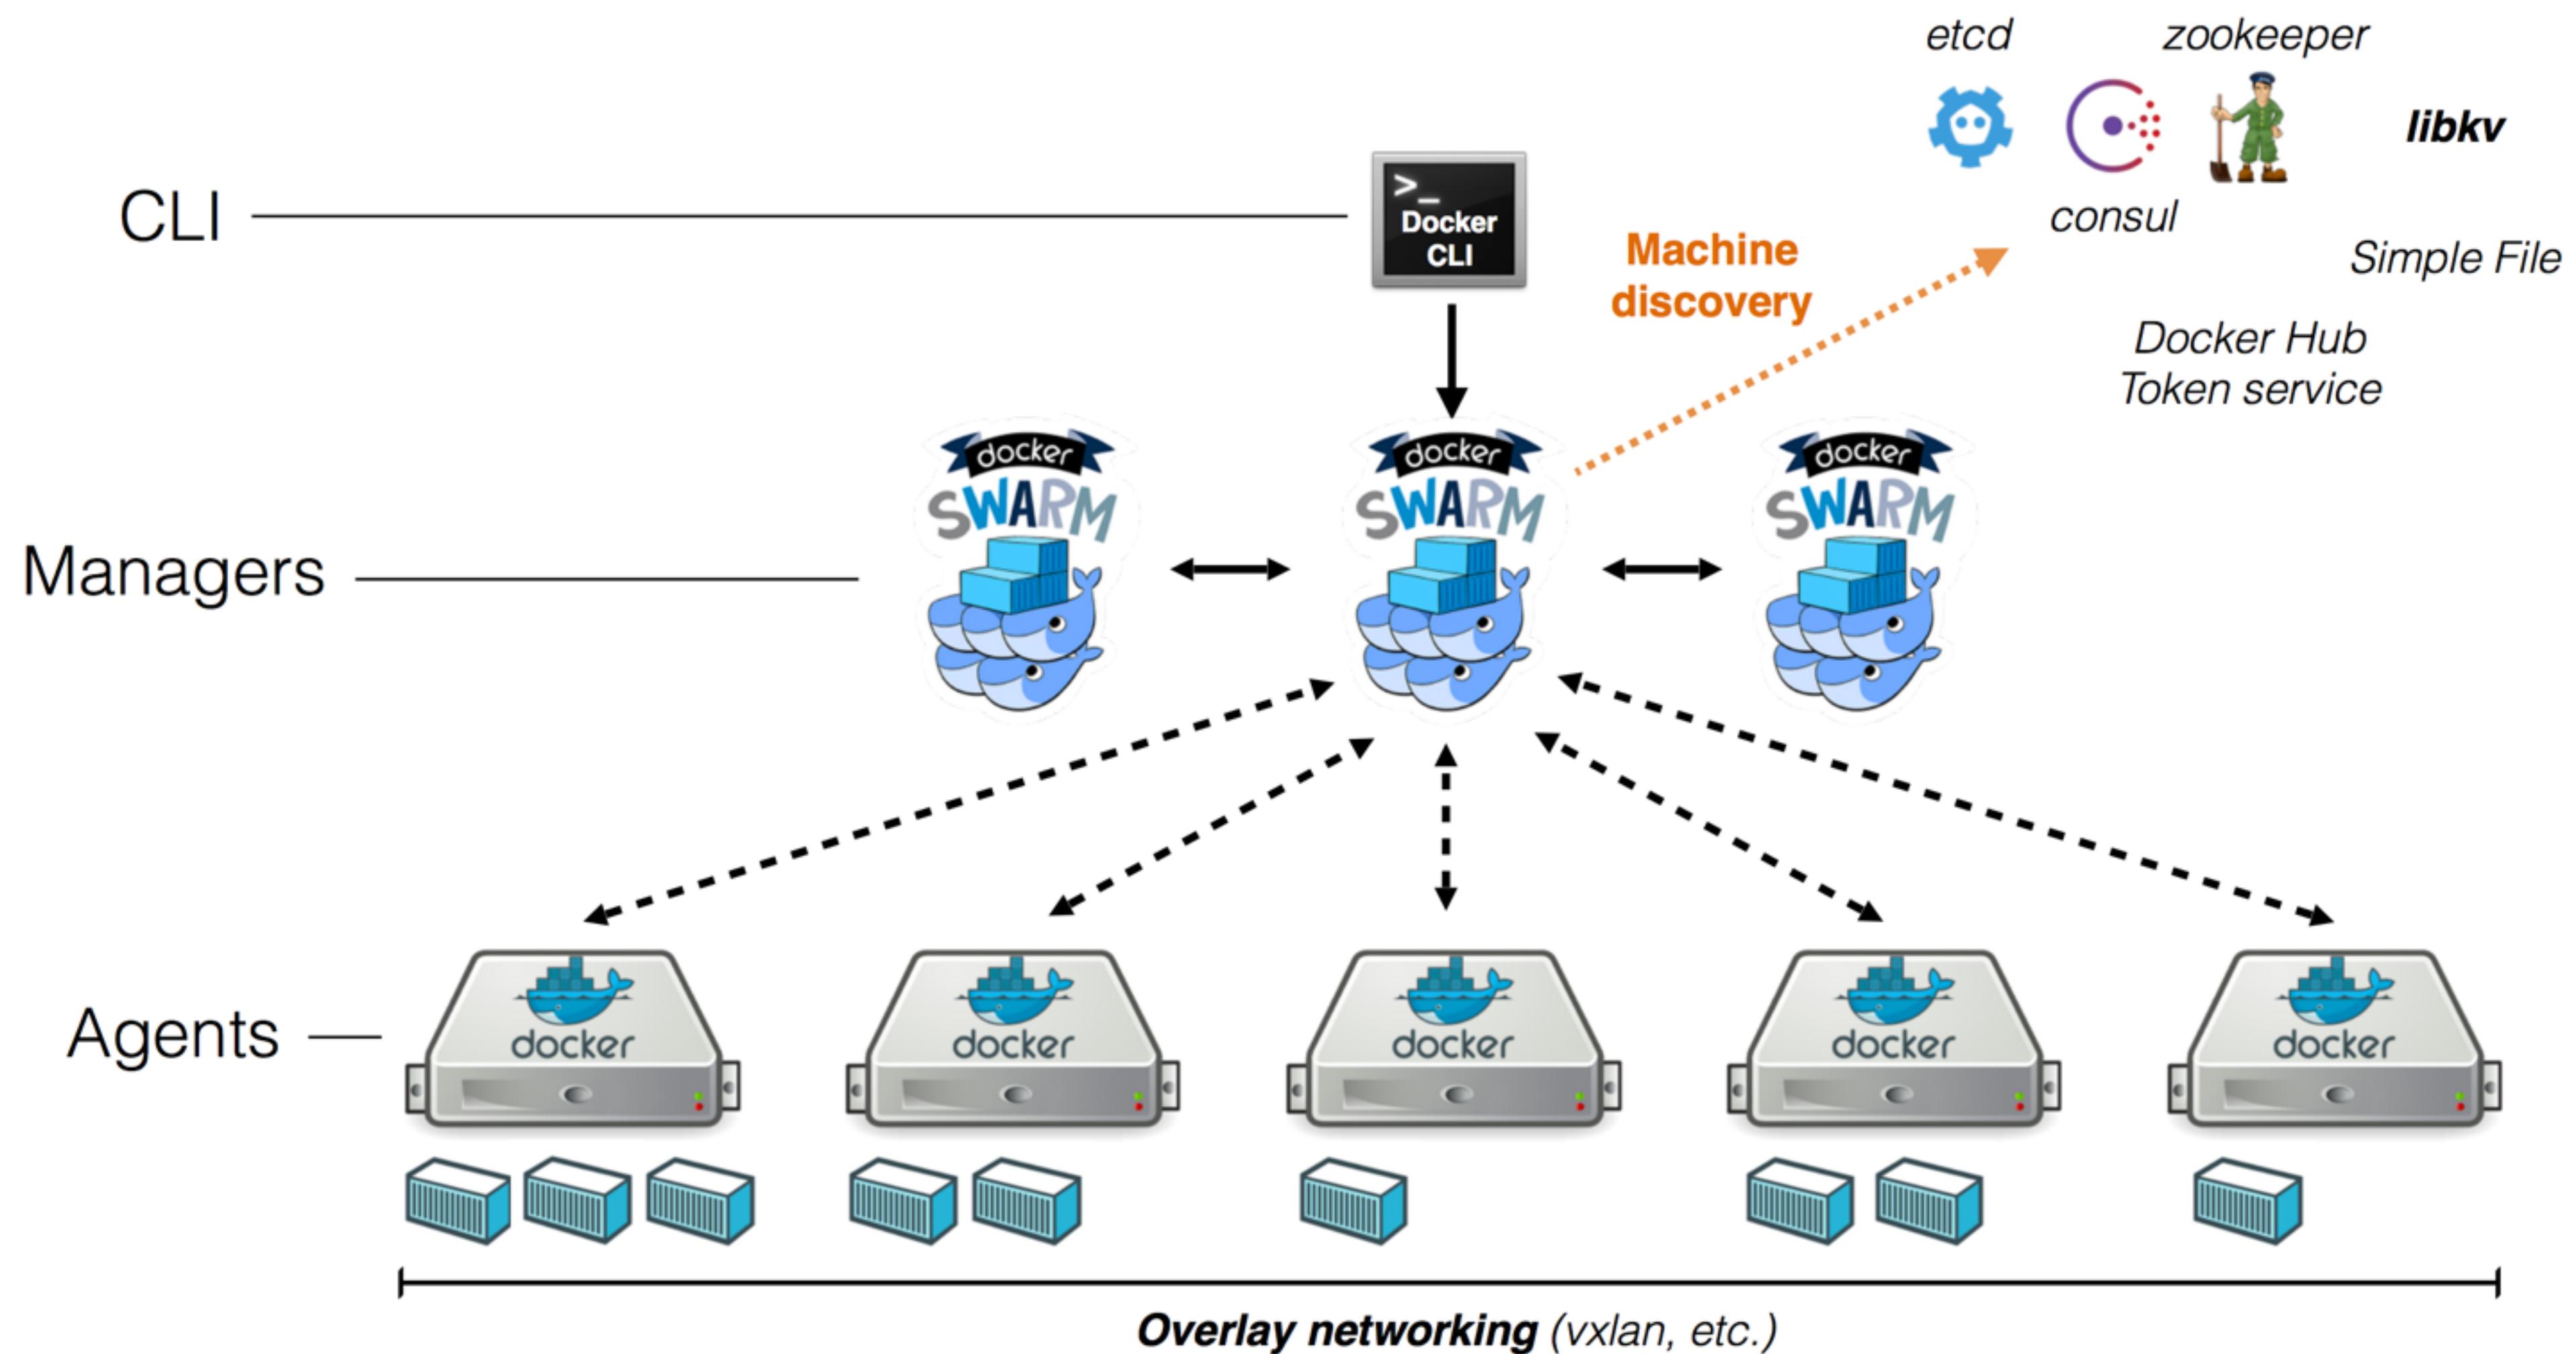

# Docker Swarm

- Native clustering for Docker
- Provides a unified interface to a pool of Docker hosts
- Fully integrated with Machine and Compose
- Serves the standard Docker API
- 1.0.0 - Ready for production?

Stress tested on 1000 EC2 nodes, ~30k containers

# Node Discovery

```
docker-machine create  
--engine-opt --cluster-advertise=<value>  
--engine-opt --cluster-store=<value>  
--engine-opt -cluster-store-opt=<value>  
-d=virtualbox  
myMachine
```

# Master High Availability

- Handle the failover of a manager instance
- **Primary** manager, multiple **replica** instances
- Requests to replica are proxied to primary
- `docker run swarm manage`
  - `--replication`: Enable Swarm manager replication
  - `--replication-ttl "30s"`: Leader lock release time on failure
  - `--advertise`, `--addr`: Address of the swarm manager joining the cluster

# Scheduling Backends

- Based on CPU (-c), RAM (-m), number of containers
- `docker machine create --strategy <value>`
  - `spread (default)`: node with least number of running containers
  - `binpack`: node with most number of running containers
  - `random`: mostly for debugging
- API for pluggable backends (e.g. Mesos) coming

# Limiting CPU resources

```
docker run --help | grep cpu  
--cpu-shares=0  
--cpu-period=0  
--cpu-quota=0  
--cpuset-cpus=  
--cpuset-mems=
```

CPU shares (relative weight)  
Limit CPU CFS (Completely Fair Scheduler) period  
Limit CPU CFS (Completely Fair Scheduler) quota  
CPUs in which to allow execution (0-3, 0,1)  
MEMs in which to allow execution (0-3, 0,1)

-c=1024

-c=512

-c=512

# Machine + Swarm + Compose

# Persistent Storage

- Data volumes - used to persist data independent of container's lifecycle
- Multiple plugins: Flocker, Ceph, . . .

```
docker volume --help
```

```
Usage: docker volume [OPTIONS] [COMMAND]
```

```
Manage Docker volumes
```

```
Commands:
```

```
  create  
  inspect  
  ls  
  rm
```

```
Create a volume
```

```
Return low-level information on a volume
```

```
List volumes
```

```
Remove a volume
```

# Persistent Storage

Create a volume

```
docker volume create --name=data data
```

Run a container with the volume

```
docker run -it -v data:/opt/couchbase/  
var couchbase/server
```

# docker network

```
docker network --help
```

**Usage:** docker network [OPTIONS] COMMAND [OPTIONS]

**Commands:**

disconnect  
inspect  
ls  
rm  
create  
connect

Disconnect container from a network  
Display detailed network information  
List all networks  
Remove a network  
Create a network  
Connect container to a network

# Docker Compose and Networking

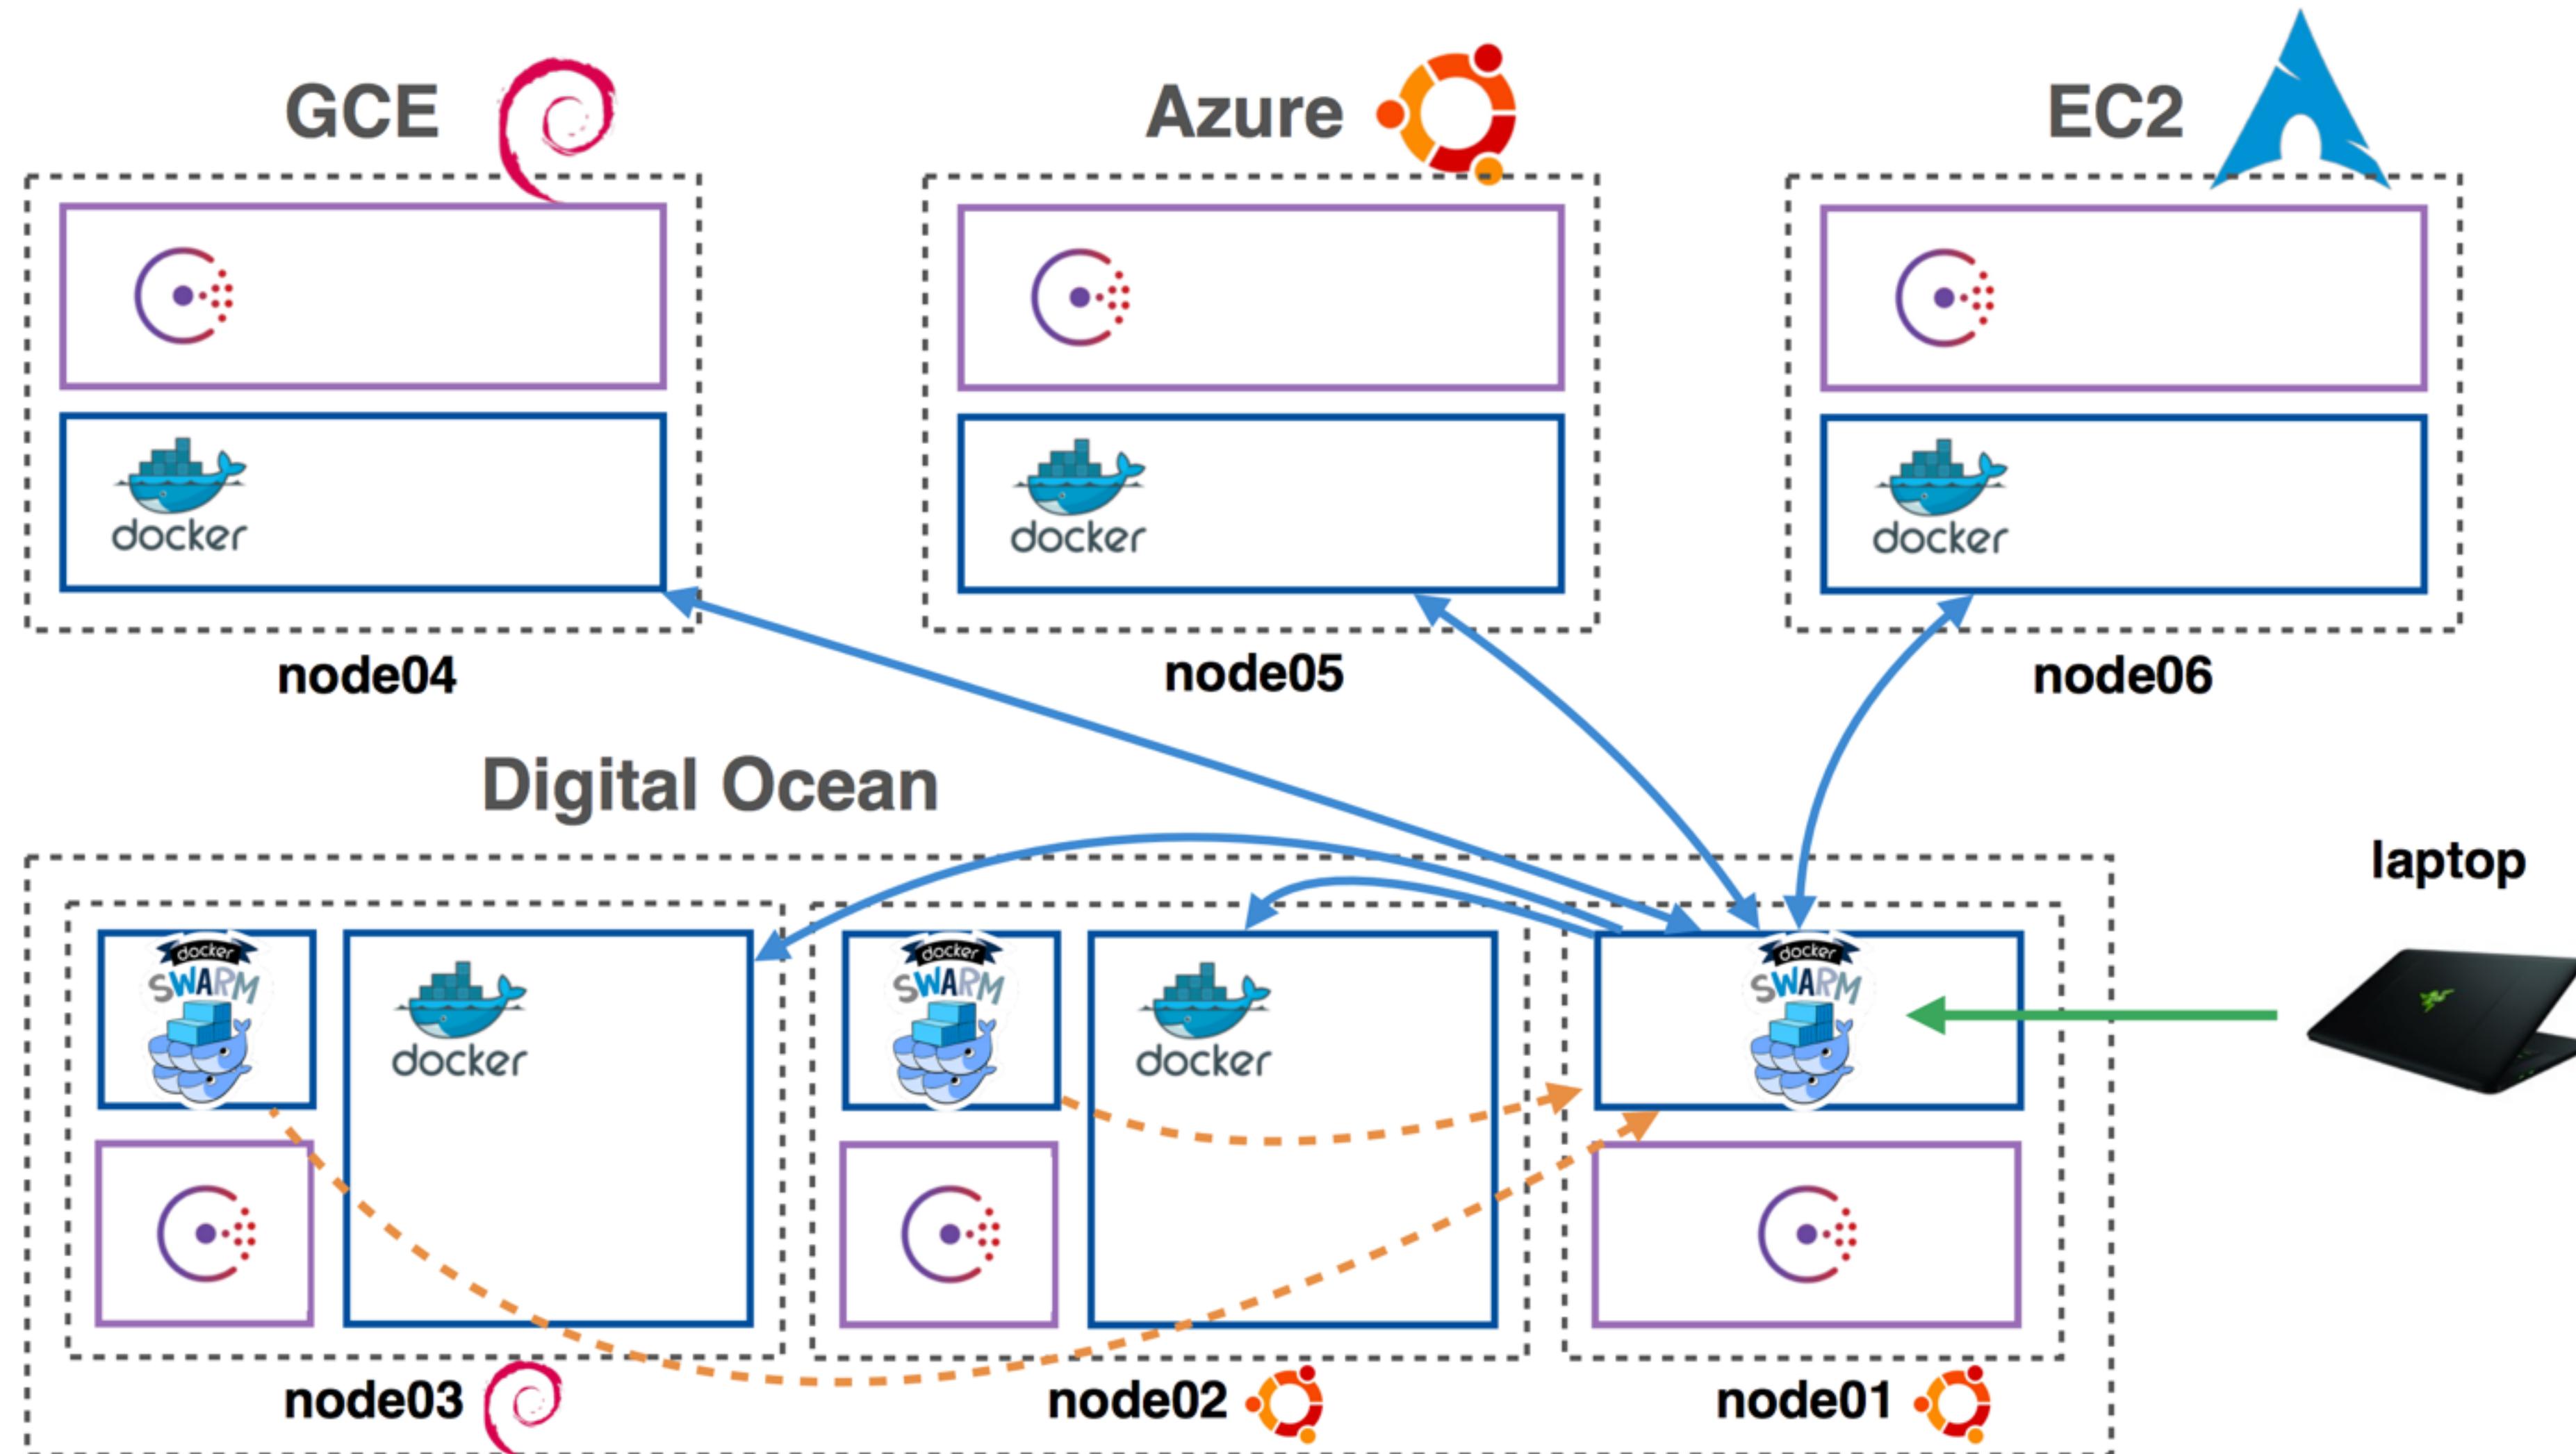

- `docker network ls`
